ASSA ABLOY is committed to providing products and services that are environmentally sound throughout the entire production process and the product lifecycle. Our unconditional aim is to make sustainability a central part of our business philosophy and culture, but even more important is the job of integrating sustainability into our business strategy. The employment of EPDs will help architects, designers and LEED-APs select environmentally preferable door openings. The Trio-E EPD provides detailed requirements with which to evaluate the environmental and human health impacts related to producing our door openings. ASSA ABLOY will continue our efforts to protect the environment and health of our customers/end users and will utilize the EPD as one means to document those efforts.
This declaration is an environmental product declaration (EPD) in accordance with ISO 14025. EPDs rely on Life Cycle Assessment (LCA) to provide information on a number of environmental impacts of products over their life cycle. Exclusions: EPDs do not indicate that any environmental or social performance benchmarks are met, and there may be impacts that they do not encompass. LCAs do not typically address the site-specific environmental impacts of raw material extraction, nor are they meant to assess human health toxicity. EPDs can complement but cannot replace tools and certifications that are designed to address these impacts and/or set performance thresholds – e.g. Type 1 certifications, health assessments and declarations, environmental impact assessments, etc. Accuracy of Results: EPDs regularly rely on estimations of impacts, and the level of accuracy in estimation of effect differs for any particular product line and reported impact. Comparability: EPDs are not comparative assertions and are either not comparable or have limited comparability when they cover different life cycle stages, are based on different product category rules or are missing relevant environmental impacts. EPDs from different programs may not be comparable.

**REFERENCE PCR**
- Part A: IBU: Product Category Rules for Construction Products from the range of Environmental Product Declarations of Institut Bauen und Umwelt (IBU), Part A: Calculation Rules for the Life Cycle Assessment and Requirements on the Background Report. April 2013

**DATE OF ISSUE**
February 21, 2014

**PERIOD OF VALIDITY**
5 years

**SCOPE**
This EPD is Manufacturer Declaration (1a) – Declaration of a specific product from a manufacturer’s plant. The owner of the declaration shall be liable for the underlying information and evidence.

**CONTENTS OF THE DECLARATION**
- Product definition
- Information about basic material and the material’s origin
- Description of the product’s manufacture
- Indication of product processing
- Life cycle assessment results
- Testing results and verifications

The PCR review was conducted by: The independent expert committee

The CEN Norm EN 15804 serves as the core PCR. This declaration was independently verified in accordance with ISO 14025 by Underwriters Laboratories

☐ INTERNAL
☒ EXTERNAL

Anna Nicholson

This life cycle assessment was independently verified in accordance with ISO 14044 and the reference PCR by: IBU - Institut Bauen und Umwelt e.V.
1. General Information

**ASSA ABLOY Door Group, LLC**

**Programme holder**
IBU - Institut Bauen und Umwelt e.V.
Panoramastr. 1
10178 Berlin
Germany

**Declaration number**
EPD-ASA-20130283-IBC1-EN

**This Declaration is based on the Product Category Rules:**
Windows and doors, 10-2012
(PCR tested and approved by the independent expert committee)

**Issue date**
21.02.2014

**Valid to**
20.02.2019

**Owner of the Declaration**
Curries
12 Street NWest 1502
50401 Mason City, IA, TN
USA

**Declared product / Declared unit**
This declaration represents 1 TrioE Steel Stiffened Door prime painted.

**Scope:**
This declaration and its LCA study are relevant to TrioE steel stiffened polyurethane foam in place core 1 3/4" (4.445 cm) hollow metal doors manufactured from 18 gauge cold rolled steel or optional 16 gauge galvanized steel face sheets at a single manufacturing ASSA ABLOY Door Group site - Ceco Door, Milan, TN, USA. All TrioE door component assembly and manufacturing processes are performed at our manufacturing factory - Ceco Door - Milan, TN, USA. The TrioE doors are marketed under the following ASSA ABLOY Door Group brands: CURRIES (Mason City, Iowa, USA). The owner of the declaration shall be liable for the underlying information and evidence; the IBU shall not be liable with respect to manufacturer information, life cycle assessment data and evidences.

**Verification**
The CEN Norm EN 15804 serves as the core PCR
Independent verification of the declaration and data according to ISO 14025

Dr. Burkhart Lehmann
(Managing Director IBU)

Prof. Dr.-Ing. Horst J. Bossenmayer
(President of Institut Bauen und Umwelt e.V.)

2. Product

2.1 Product description
Trio-E steel stiffened door is for exterior commercial applications where green factors, strength, sustainability and aesthetics all play a role. The Trio-E door is part of a complete door opening, utilizing thermal break or kerf frames and PEMKO thermal barrier saddles, to offer operable U-Factor (0.29), while maintaining the strength to withstand winds up to 100 psf. The door is manufactured without any visible weld marks, to achieve a beautiful energy efficient opening.

2.2 Application
The Trio-E can be used indoors or outdoors. Common applications are: interior or exterior door openings, motels/hotels, office buildings, urban renewal, health care, institutional, data processing, mercantile, food processing, school/training centers, public utility stations, warehouses/factories, manufacturing plants, transportation terminals, vehicle service facilities and government buildings.

2.3 Technical Data
TRIO-E Doors conform to the Steel Door Institute guide specification, ANSI A250.8 Recommended Specifications for Standard Steel Doors and Frames and ANSI / NAAMM / HMMA 867-06 Guide Specifications for Commercial Laminated Core Hollow Metal Doors and Frames; Available Sizes: 4’0” x 8’0” maximum single, 8’0” x 8’0” maximum pair.

The table below presents the technical properties of the product:

<table>
<thead>
<tr>
<th>Construcional data</th>
<th>Name</th>

</tr>
</tbody>
</table>
2.4 Placing on the market / Application rules

Trio-E doors conform to the Steel Door Institute guide specifications and ASTM / ANSI American Standards, Underwriters Lab and Warnock Hersey Agency:

- /ANSI /SDI A250.4-2011/ Physical Endurance for Steel Doors, Frames & Frame Anchors Physical endurance testing
- /ANSI/UL 10C/ Positive Pressure Fire Tests of Door Assemblies

2.5 Delivery status

Finished Trio-E doors are individually packaged then placed horizontally on cardboard pallet and banded to pallet for shipment. Minimum of 1 and max 20 doors per pallet. Package sizes: Package dimensions are proportionate to the door size: e.g. 30” x 70” door pallet will be 3'0" x 7'0" x 44" (20 doors + 4" high pallet) 4'0" x 8'0" maximum width, 20 doors/pallet = 44" height.

2.6 Base materials / Ancillary materials

The composition of the steel door (excluding packaging) is as following:

<table>
<thead>
<tr>
<th>Component</th>
<th>Percentage in mass (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel face sheet / components - CRS</td>
<td>95</td>
</tr>
<tr>

<td>3</td>
</tr>
<tr>
<td>Total</td>
<td>100</td>
</tr>
</tbody>
</table>

2.7 Manufacture

Door production process utilizes cutting, forming, stamping, CNC, welding, grinding and electrostatic water based painting equipment. Door skins & components are fabricated from 18 ga or 16 ga cold rolled steel conforming to /ASTM A1008/ or hot-dipped galvanized steel conforming to /ASTM 924/ and /ASTM 653/. Top & Bottom door skins are mechanically interlocked and welded, hemmed vertical edge seams. Hardware reinforcements for most lock preps, including concealed hardware, 7 gauge steel hinge reinforcements. Hinge preparations are handed. Hinge edges are mortised for 4-1/2" or 5" high, standard and heavy weight hinges. Core: 22 gauge steel stiffeners welded spaced every 6" apart with injected polyurethane foam in place core. Paint: Electrostatically applied water based primer base coat per /ANSI A250.10/., Optional Colorstyle factory pre-finish per /ANSI A250.3/.

2.8 Environment and health during manufacturing

ASSA ABLOY Door Group and Ceco are committed to protecting human health and the environment; meeting or exceeding Federal, State, and local laws,
regulations, codes and guidelines; and employing sustainable pollution prevention practices. Painting and welding areas of manufacturing plant have extraction ventilation system to remove dust. Volatile Organic Compounds (VOC) and air borne materials. Sound abatement is implemented where possible and Personal Protective Equipment is provided. Waste water is pre-treated prior to dispensing into city water system. A large portion of power supply available on the grid to the plant is generated from nearby TVA hydroelectric generation. (TVA dam systems)

• Ceco's production process is third party certified by /UL Environment 102/.
• Routinely monitoring our environmental operations, Greenhouse Gases (GHG), energy, water, waste, VOC, surface treatment. Conduct periodic inspections, audits, and reviews to ascertain that we meet applicable standards and to evaluate our Environment Management program effectiveness.
• Code of Conduct covers human rights, labor practices and decent work. Personnel are aware of their environmental roles and responsibilities, providing appropriate training, supporting accountability and recognizing outstanding performance.

2.9 Product processing/Installation
Doors are typically installed into commercial applications per local, state and federal building codes, standards and requirements. Personal Protective Equipment should be provided at construction site.

2.10 Packaging
Trio-E Doors are individually wrapped in protective cardboard and banded with polyethylene to retain door protective packaging. Doors are stacked horizontally on cardboard pallet and banded to pallet for shipment. (max 20 doors per pallet). Corrugated packaging is 100% recycled, packaging material and polyethylene banding should be removed from packaging and collected separately for recycling.

2.11 Condition of use
Doors are only prime painted, unless the customer orders the doors factory finish painted. Doors receive an environmentally friendly primer finish designed to provide a rust inhibiting substrate and is intended as a preparatory base for field painting. The primer finish is not designed to be the final layer of protection from outside elements. Primed doors should receive a finish paint topcoat per /S.D.I. / NAAMM / HMMA/ standards for performance. Gasketing and thresholds are used to control the flow of air, smoke, heat or cold, water, and sound through the door opening. The location or intended use of the door assembly, the environment to which it is exposed, and the performance expected will dictate the selection of gasketing and threshold products and the amount of maintenance required. Typical maintenance is to service the painted surface by re-coating the doors as necessary (location and environment will vary the time). This is usually after about 5 years in the field (but can be longer depending on exposure and environment). Repairs or replacement are not usually necessary. No cleaning efforts need to be taken into consideration.

2.12 Environment and health during use
There is no harmful emissive potential. No damage to health or impairment is expected under normal use corresponding to the intended use of the product.

2.13 Reference service life
Properly installed and maintained steel hollow metal doors often last 30 years or longer. Steel Door Institute test standard /ANSI/SDI A250.4-2001/ Level A requires 1,000,000 cycles - Trio-E doors have cycle tested (open/closed) 4,800,000 cycles with no issues. The location and intended use of the steel door assembly, the environment to which it is exposed, and the cycling of the door assembly will determine the steel door assembly life expectancy.

2.14 Extraordinary effects

Fire
Fire Protection
Fire Door Labeling Agency: UL and Warnock Hersey Test: /UL10C/ /UL10B/ /NFPA 252/
Rating: UL 20 min. to 3 Hours Max size: 4'0" x 8'0" single. Max size 8'0" x 8'0" Pair
WH 20 min. to 1 1/2 hour Max size: 4'0" x 8'0" single.

Water
No substances are used which have a negative impact on ecological water quality on contact by the door with water. Steel doors subjected to unforeseeable flooding conditions will increase the potential for developing surface rust. The door is designed for traditional locations and is not intended for flood protection.

Mechanical destruction
No impact on human health and environment is known or expected. Especially no hazardous substance can be anticipated in case of a mechanical destruction.

2.15 Re-use phase
It is possible to reuse the product during the reference service life and it can be moved from one similar door opening to another. The major material, by weight, in door components is steel, which can be recycled.

2.16 Disposal
In collaboration with the Steel Recycling Institute, customers can utilize a locator tool, allowing them to find a recycling center near them. The locator tool is hosted on the Steel Recycling Institute’s website (www.recycle-steel.org); it simply asks the user for location information, and provides the nearest recycling location. The tool is free to use and allows the consumer to travel just a short distance to properly dispose of their materials. This free program provides recycling and/or disposal of door and frame products that have reached the end of their life cycle and are beyond the product’s warranty period. European Waste Catalogue Code: 15 01 01 Paper and Cardboard Packaging, 15 -1 -3 Wooden Packaging, 17 02 02 Glass, 17 04 05 Steel, 20 01 02 Glass, 20 01 40 Metal. See: LCA, PCR.

</tr>
<tr>
<td>Ratio to reference door</td>
<td>0.728</td>
<td></td>
</tr>
</tbody>
</table>

Ratio to reference door: Measuring 1.23 m x 2.18 m = 2.68 sqm/pc (reference door based on EN14351-1)

### 3.2 System boundary

Type of the EPD: cradle to gate - with options

The following life cycle phases were considered for Trio-E steel door:

**A1-A3 Production phase:**
- A1 – Raw material extraction and processing
- A2 – Transport to the manufacturer and
- A3 – Manufacturing.

**A4-A5 Construction phase:**
- A5 – Packaging waste processing

**The use phase:**
- B2 - Maintenance (surface treatment by re-coating / re-painting).

End-of-life stage:
- C2 – Transport to waste processing,
- C4 – Disposal (landfill)

These information modules include provision and transport of all materials, products, as well as energy and water provisions, waste processing up to the end-of-waste status or disposal of final residues.

### 3.3 Estimates and assumptions

Transport:
Real-world data on mode of transport and distances were considered for materials contributing more than 2% of total product mass. For parts and materials, contributing less than 2% to the total product mass, road transport over an average distance of 500km was assumed.

**EOL:**
In the End-of-Life phase a recycling scenario with 100% collection rate was assumed.

**3.4 Cut-off criteria**

In the assessment, all available data from production process were considered, i.e. all raw materials used, auxiliary materials (e.g. lubricants), thermal energy consumption and electric power consumption - including material and energy flows contributing less than 1% of mass or energy (if available).

For raw materials, contributing more than 2% to the total product mass, means of transportation and distances were modeled in more detail to better reflect the reality; for materials or product parts, contributing less than 2% of total product mass, average distances and standard means of transport were assumed.

The overall contribution derived from these assumptions does not exceed 5% to the impact categories under consideration. Impacts relating to the production of machines and facilities required during production are out of the scope of this assessment.

**3.5 Background data**

For life cycle modeling of the considered products, the /GaBi 6/ Software System for Life Cycle Engineering, developed by PE INTERNATIONAL AG, is used /GaBi 6 2013/. The GaBi-database contains consistent and documented datasets which are documented in the online GaBi-documentation /GaBi 6 2013D/.

To ensure comparability of results in the LCA, the basic data of GaBi database were used for energy, transportation and auxiliary materials.

**3.6 Data quality**

The requirements for data quality and background data correspond to the specifications of the /IBU PCR PART A/.

PE INTERNATIONAL performed a variety of tests and checks during the entire project to ensure high quality of the completed project. This obviously includes an extensive review of project-specific LCA models as well as the background data used.

The technological background of the collected data reflects the physical reality of the declared products. The datasets are complete and conform to the system boundaries and the criteria for the exclusion of inputs and outputs. All relevant background datasets are taken from the /GaBi 6/ software database. The last revision of the used background data has taken place not longer than 10 years ago.

**3.7 Period under review**

The period under review is 2012/13 (12 month average).
### 3.8 Allocation

Regarding incineration, the software model for the waste incineration plant (WIP) is adapted according to the material composition and heating value of the combusted material. In this EPD the following specific life cycle inventories for the WIP are considered:

- Waste incineration of plastic from packaging
- Waste incineration of paper from packaging
- Regarding the recycling material of metals, the metal parts in the EoL are declared as end-of-waste status. Thus, these materials are considered in module D.

Regarding incineration, the software model for the waste incineration plant (WIP) is adapted according to the material composition and heating value of the combusted material. In this EPD the following specific life cycle inventories for the WIP are considered:

- Waste incineration of plastic from packaging
- Waste incineration of paper from packaging
- Regarding the recycling material of metals, the metal parts in the EoL are declared as end-of-waste status. Thus, these materials are considered in module D.

### 3.9 Comparability

Basically, a comparison or an evaluation of EPD data is only possible if all the data sets to be compared were created according to /EN 15804/ and the building context, respectively the product-specific characteristics of performance, are taken into account.

### 4. LCA: Scenarios and additional technical information

In the EPD scenarios and/or technical information for Modules B2, B6, C1-C4 and D are given.

#### Maintenance (B2)

The typical maintenance is to service the painted surface by re-coating / re-painting the doors as necessary (location and environment will vary the time). This is usually after about 5 years in the field.

6. LCA: Interpretation

This chapter contains an interpretation of the Life Cycle Impact Assessment categories. When expressed as a percentage, the impact refers to its magnitude as a percentage of total product impact across all modules, with the exception of module D.

Production phase (module A1-A3) contributes between 96 and 100% to total impact assessment. This stage is dominated by upstream emissions associated with steel making processes. The environmental impacts for the transport (A2) have a negligible impact within this stage.

In module D the benefits (negative values) and loads beyond the system boundary are declared for the recycling potential of the metals and for the credits from the incineration process (energy substitution) within A5.

7. Requisite evidence

Not applicable in this EPD.
